Churchill manitoba weather report. Teulon manitoba weather report. Saskatchewan manitoba weather report. Brandon manitoba weather report. Neepawa manitoba weather report. Ashern manitoba weather report. Holland manitoba weather report. Selkirk manitoba weather report.

Page Content Manitoba's ag weather program measures and records data year round from over 100 weather stations across agro-Manitoba. The stations monitor air temperature, relative humidity, barometric pressure, precipitation, wind speed and direction, solar radiation, soil temperature, and soil moisture. The latest weather conditions from each station are made available every 15 minutes throughout the growing season and every hour during the winter months. Special Maps Agro-Manitoba Weather Extremes Weekly Crop Weather Report and Maps The latest weather report and maps are made available every Monday year round. Subscribe to receive a weekly distribution of seasonal reports and maps by email. Latest Crop Weather Report (PDF 33 KB) Archived Crop Weather Reports Higher resolution maps are available on request. Eight-Day Accumulated Precipitation Map (PDF 2 MB) (July 25- August 1, 2022) shows that precipitation across agro-Manitoba ranged from 1.1 mm to 75.7 mm in the past eight days. Roblin (75.7 mm), Fisherton (73 mm), and Rosa (58.4 mm) were the top three locations with the highest amount of precipitation last week. The southwest region west of Shilo mostly got less than 10 mm. Total Accumulated Precipitation (PDF 2 MB) (May 01- August 1, 2022) shows the total precipitation amount since May 1. McCreary, Arborg and Marchand have reported the highest total accumulated precipitation at 435 mm, 415 mm and 412 mm, respectively. Most locations in the Interlake and Eastern regions have received 300 - 380 mm. Other regions have mostly received 220 - 300 mm. Percent of Normal Accumulated Precipitation (PDF 2 MB) (May 01 - August 1, 2022) is based on historical record over a 30-year period. Many areas in Interlake and west of Lake Manitoba have received at least 150% of normal precipitation. Arborg (218%), Alonsa (203%) and Riverton (202%) are the top three locations with the highest percent of normal precipitation. These areas have received more than twice the historical amount of precipitation since May 01, 2022. Top 0-30cm Soil Moisture (PDF 629 KB) (August 1, 2022) shows a regional representation of soil moisture conditions for the top 30 cm on August 1, 2022 relative to field capacity. Most locations have wet surface soil moisture due to recent precipitation. Locations showing dry surface soil moisture include areas in the far southwest corner around Pierson and Waskada; locations south of the Riding Mountain National Park around Newdale and Shilo; and some areas around the Red River. Top 0-120cm Soil Moisture (PDF 625 KB) (August 1, 2022) shows a regional representation of soil moisture conditions for the top 120 cm on August 1, 2022 relative to field capacity. Most areas monitored showed wet conditions at the top 120 cm. The areas around Moosehorn, Eden, Forrest, Pierson and Morris are showing dry to very dry conditions at the entire soil profile. Total Accumulated Growing Degree Days (PDF 2 MB) (May 01- August 1, 2022) shows the accumulated growing degree days (GDD) for the period of May 01 - August 1, 2022. The highest total GDD accumulation was observed at Winkler with 1,119 units. Areas from Portage in the central region to St. Adolphe and south to the International border have mostly accumulated at least 1,000 heat units. However, most areas in the northwest region have accumulated less than 920 units. Percent Normal Accumulated Growing Degree Days (PDF 2 MB) (May 01- August 1, 2022) represents the variation of accumulated Growing Degree Days (GDD) from the historical record over a 30-year period. Some areas in the southwest, Interlake and around Winnipeg have accumulated 100 - 105% of normal heat unit accumulation. Most areas have accumulated between 95 - 100%, except locations close to the Saskatchewan border which is mostly at 90 - 95% of normal. The highest percent of normal accumulated GDD is at Arborg (111% of normal). Total Accumulated Corn Heat Units (PDF 2 MB) (May 01- August 1, 2022) illustrates the total accumulated Corn Heat Units (CHU) for the growing season to date. The northwest region has mostly accumulated less than 1,540 CHU. Areas near Morden (1,807), Winkler (1,804) and Gretna (1,787) have accumulated the most CHU since May 1. Percent Normal Accumulated Corn Heat Units (PDF 2 MB) (May 01- August 1, 2022) represents the variation of accumulated corn heat units (CHU) from the historical record over a 30-year period. All regions have mostly accumulated between 95-105% of the historical accumulated CHU. Arborg and Wawanesa have accumulated the highest percent normal accumulated CHU at 106% compared to the 30-year average. Total Accumulated P-Days (PDF 2 MB) (June 06 - August 1, 2022) represents the total accumulated physiological days for potatoes (P-days) since June 6, 2022. P-days accumulation has a different start date because accumulation commences at about 50% potato emergence. Other heat accumulations start from May 1. Taylor's Point (482 units) have accumulated the highest P-days and areas around Lake Manitoba have received above 470 p-day units. Percent of Normal Accumulated P-Days (PDF 2 MB) (June 06 - August 1, 2022) represents the variation of accumulated physiological days for potatoes (P-days) from the historical record over a 30-year period. Much of agro-Manitoba has accumulated above historical average P-Days since June 6 with most areas having above 105% of normal p-days. The information on the maps provides regional representation. Field-specific conditions may be different from the information provided on the maps. Other links of interest to access current weather conditions recorded at each station: - Current Weather Condition by Station. Last Spring Frost Monthly Precipitation 2021 Seasonal Reports Visit the Seasonal Reports page for information on progress in seeding and crop establishment, crop development, pest activity including weeds, insects and disease, harvest progress, crop yields and grades, fall field work progress, and status of winter cereal crop seeding and establishment. Information on haying progress and estimated yields, as well as pasture conditions is included. Nationwide, you can view weather on CBC News Network, 7 days a week. Don't forget, your local weather forecast is available in your area on the CBC regional nightly news. Tune in for weather: regional, national and international, coming your way from our team of meteorologists!
